WASM PDF READER

a PDF parser and rasterizer compiled to WebAssembly

One file, three pages, no server

Everything on this page was drawn by the bundled C++ reader: the text is positioned with the standard-14 Helvetica metrics, the rules and the boxes are vector paths, and the page is rasterized to RGBA in WebAssembly.

The same module exposes a text layer, so a viewer built on this library can select, copy and search without a second parser.

accent

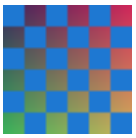
success

warning

dashed stroke, round joins, one path operator chain

Images and clipping

The 48 × 48 checker below is an /Image XObject with a FlateDecode stream.



0,0	1,0	2,0	3,0	4,0	5,0
0,1	1,1	2,1	3,1	4,1	5,1
0,2	1,2	2,2	3,2	4,2	5,2
0,3	1,3	2,3	3,3	4,3	5,3

this orange band is clipped to the rectangle on the left

Clipping is applied with the W n operator pair, exactly as a print engine would: the fill below it is much wider than the visible area. Text comes from glyph runs the reader reports in page space, which is what a selection or search layer consumes.

Landscape, /Rotate 90

The media box is 612 x 792 with a /Rotate 90 entry, so the displayed page is 792 x 612 and the content is turned.

vector bars

ROTATED

the same glyphs, rotated with the page
